|   | → BIT Instructions                             | 26 |
|   | → TAGS with ALIAS                              | 27 |

**RSLogix 5000 -- PART 1**

- PLC Codes (Contd.)**
  - NC Contacts, NO Contacts, Coils** 31
  - Branches** 32
- Completion of Motor Controls Codes (WO HMI Tags)** 33
  - Base Tags / HMI Tags** 34
  - Editing / Adding New Rung Comments** 35
  - Verifying The Program -- Subroutines / Whole CPU** 36

### UNDERSTANDING THE PROGRAM ARCHITECTURE : **SHOULD LOOK LIKE:**

➡ It's like a "LIBRARY" & you pick a Book: Now Each Book has got a "NAME", and immediately followed by it's "CONTENTS", explaining what each Chapters are about

➡ Theoretically, in each book the Writer might have omitted the Chapter "Contents portion", like straight way could have started writing the book, it might have worked, but would have been a reader's nightmare!

#### **We follow exactly the same pattern when we write PLC Codes:**

➡ The Code, i.e. the PLC "File" got a name, similar to a "LIBRARY" of books, Let's give a name: "PLC\_Test\_1"

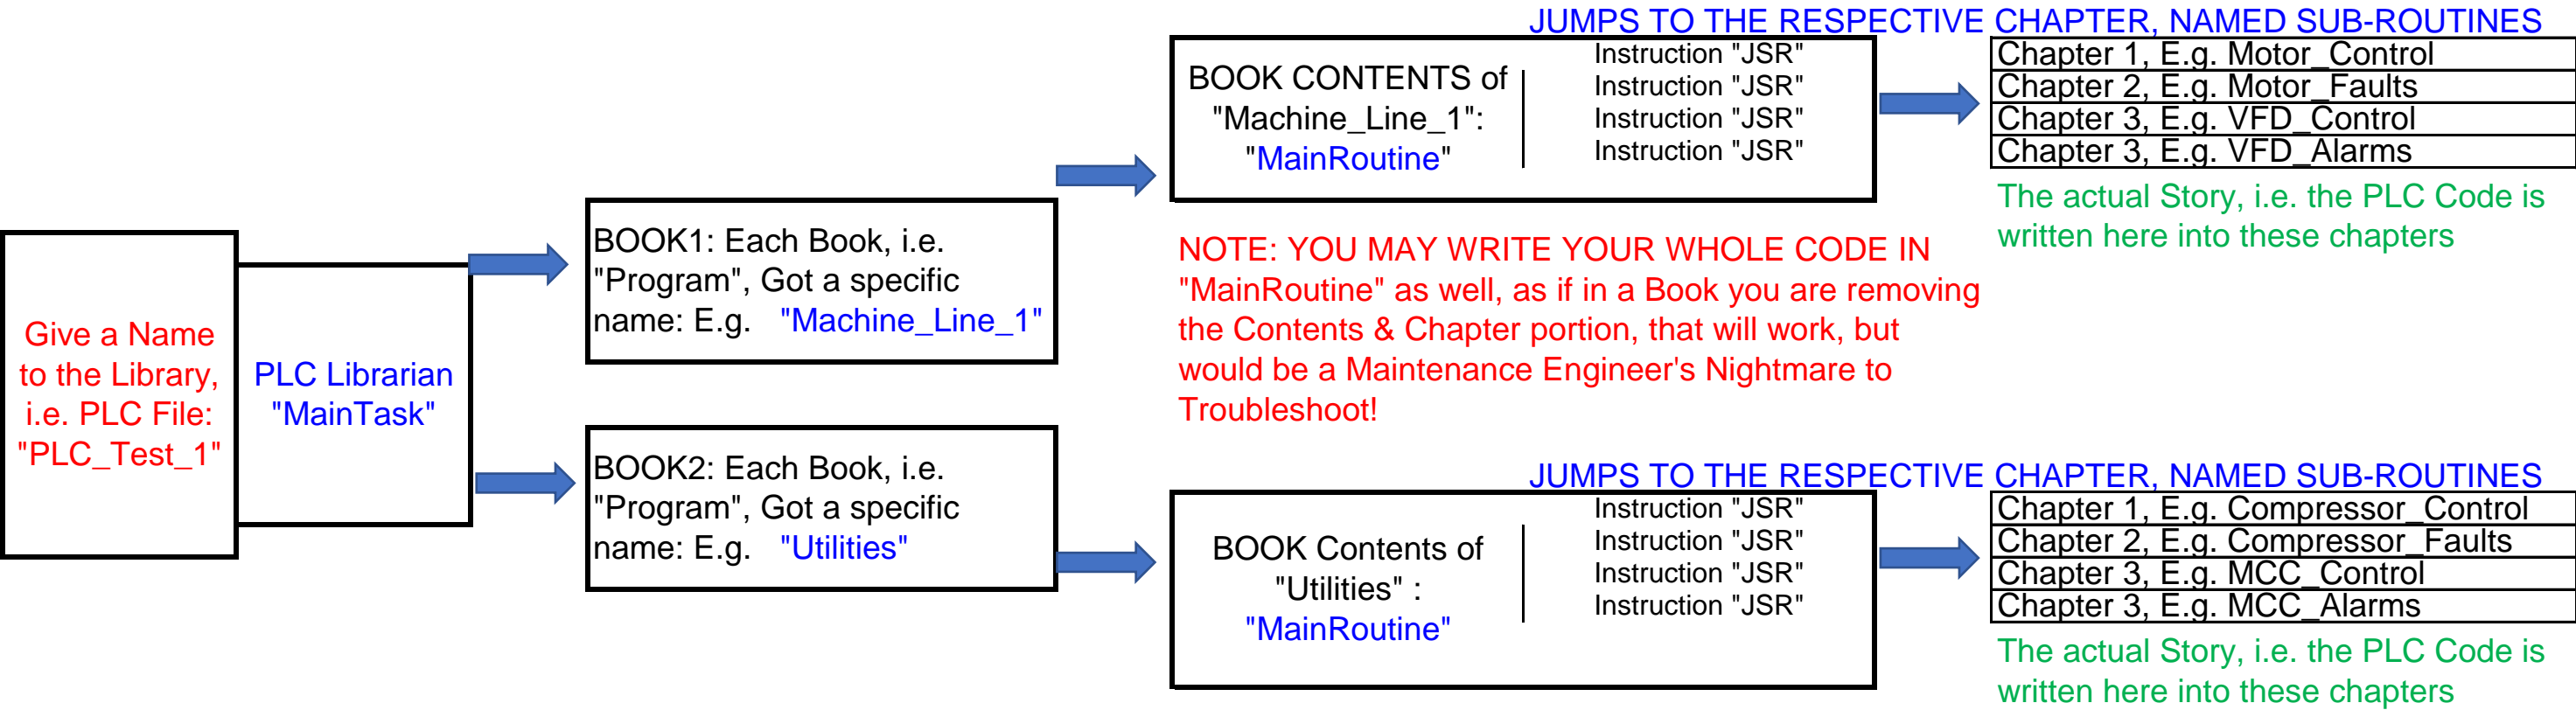

➡ The Librarian here, named as "MAIN Task"; Under Main task -- different books reside, each BOOK named as "PROGRAM X, Y, Z,...."

➡ Each "BOOK" Like "PROGRAM -X" got written into different chapters, named "Routine/SubRoutines"

➡ FINALLY, The book "Content" named as "MainRoutine", which calls in all the Chapters of the specific book, i.e. Routine through an Instruction named "JSR" Or Jump To Subroutines.

### UNDERSTANDING THE ARCHITECTURE

PROGRAM ARCHITECTURE: SHOULD LOOK LIKE:

## THE PROJECT TASK:

- ⇒ A Motor Control: ON Push Button (PB), Off PB, Indicating Lamp Green (Motor Running), Motor / E-Stop Fault "Red Lamp", Motor Restart Timer running "Yellow Lamp".
- ⇒ The motor got a standard Power design, protected by a Motor Circuit Breaker (Over-Load Relay), whose "NO" is connected to one of the PLC's Digital INPUTS.
- ⇒ All these Push Buttons are connected to the PLC Digital INPUTS, The E-Stop Status also connected to the PLC Digital INPUTS.
- ⇒ Motor Power Contactor/Relay Coil connected to one of the PLC's DIGITAL OUTPUTS (24VDC);
- ⇒ All the Pilot Lamps / Stack Lights are connected to the PLC Digital OUTPUTS,
- ⇒ One Condition: IF THE MOTOR TRIPS DUE TO OVERLOAD Condition, there should be a minimum of 10 Seconds gap for the next Re-starting of the Motor. During this period of 10 Seconds, the "YELLOW" Lamp will FLASH.
- ⇒ However: The Above Timer "TIME" Should be adjustable from a Minimum of 5 Seconds to 20 Seconds. (More if you take the HMI Course);
- ⇒ The "RED Pilot Lamp" would be Illuminated, if either the Motor Trips Or if the E-Stop Status goes False.

**NOTE: IF YOU ARE TAKING THE HMI COURSE, All the above functions like PB, Pilot Lamps, Timer adjustments are covered under HMI Screen Graphics.**

## PROJECT TASK

THE SCHEMATICS: VERY BASICS (NOT THE WHOLE SCHEMATICS)

THE SCHEMATICS: NETWORKING ARCHITECTURE

# RSLogix 5000 -- PART 1

## THE SCHEMATICS: PLC DIGITAL INPUT CARD

THE SCHEMATICS: PLC DIGITAL OUTPUT CARD

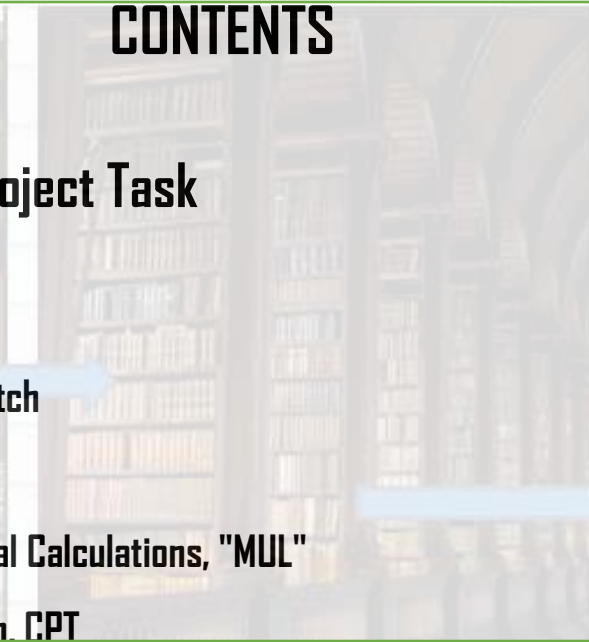

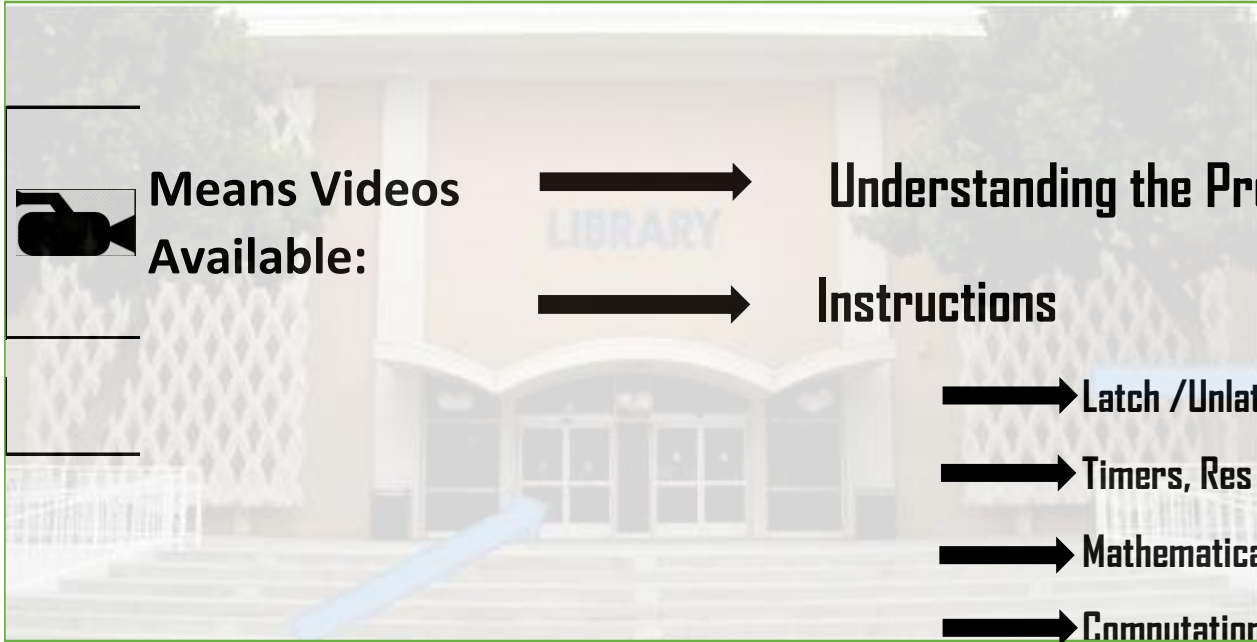

**Controls Explorer LLC**

**Means Videos Available:**

**CONTENTS**

→ **Understanding the Project Task**

→ **Instructions**

→ Latch /Unlatch

→ Timers, Res

→ Mathematical Calculations, "MUL"

→ Computation, CPT

→ **Concept of Analog Tags**

→ Analog Values, MONITOR

→ Comparison Instruction

→ **Concept of Reset, Timers**

→ **UP Counters, "NOP" Instructions**

→ Concept of RESET, Counters

→ **NEXT PROJECT: Understanding the Project Task**

|   |   |    |
|---|---|----|
| ➡ | More Instructions                           | 22 |
|   | ➡ Concept of DNS / One Shot                 | 22 |
|   | ➡ Comparison & Move                         | 25 |
|   | ➡ Concept of AFI / Always False             | 27 |
|   | ➡ Verifying Routine / Verifying Processor   | 27 |
| ➡ | Alarm                                       | 28 |
|   | ➡ Create ALARM Tags DINT                    | 28 |
|   | ➡ Alias Alarm DINT Tags BITS                | 29 |
|   | ➡ Online (Covered more in the next chapter) | 31 |
|   | ➡ Monitor Tags                              | 32 |

### UNDERSTANDING THE NEW PROJECT TASK:

- ➡ TASK: IF THE MOTOR CIRCUIT BREAKER TRIPS: RED PILOT LAMP TO BE ON;
- ➡ HMI TO HAVE INDICATION THAT THE MOTOR TRIPPED; AND THIS WILL BE LATCHED.
- ➡ HMI WILL HAVE A "RESET" PUSHBUTTON, TO UNLATCH THE FAULT, PROVIDED REAL FAULT DOES NOT EXIST.
- ➡ ONCE THE MOTOR TRIPS, CAN NOT RESTART THE MOTOR IN NEXT 5 SECONDS MINIMUM
- ➡ THIS MOTOR RESTART TIMER ADJUSTABLE, RANGE 5 SEC MINIMUM TO 15 SECONDS, MAX. (By HMI Or PLC)

RSLogix 5000 -- PART 6

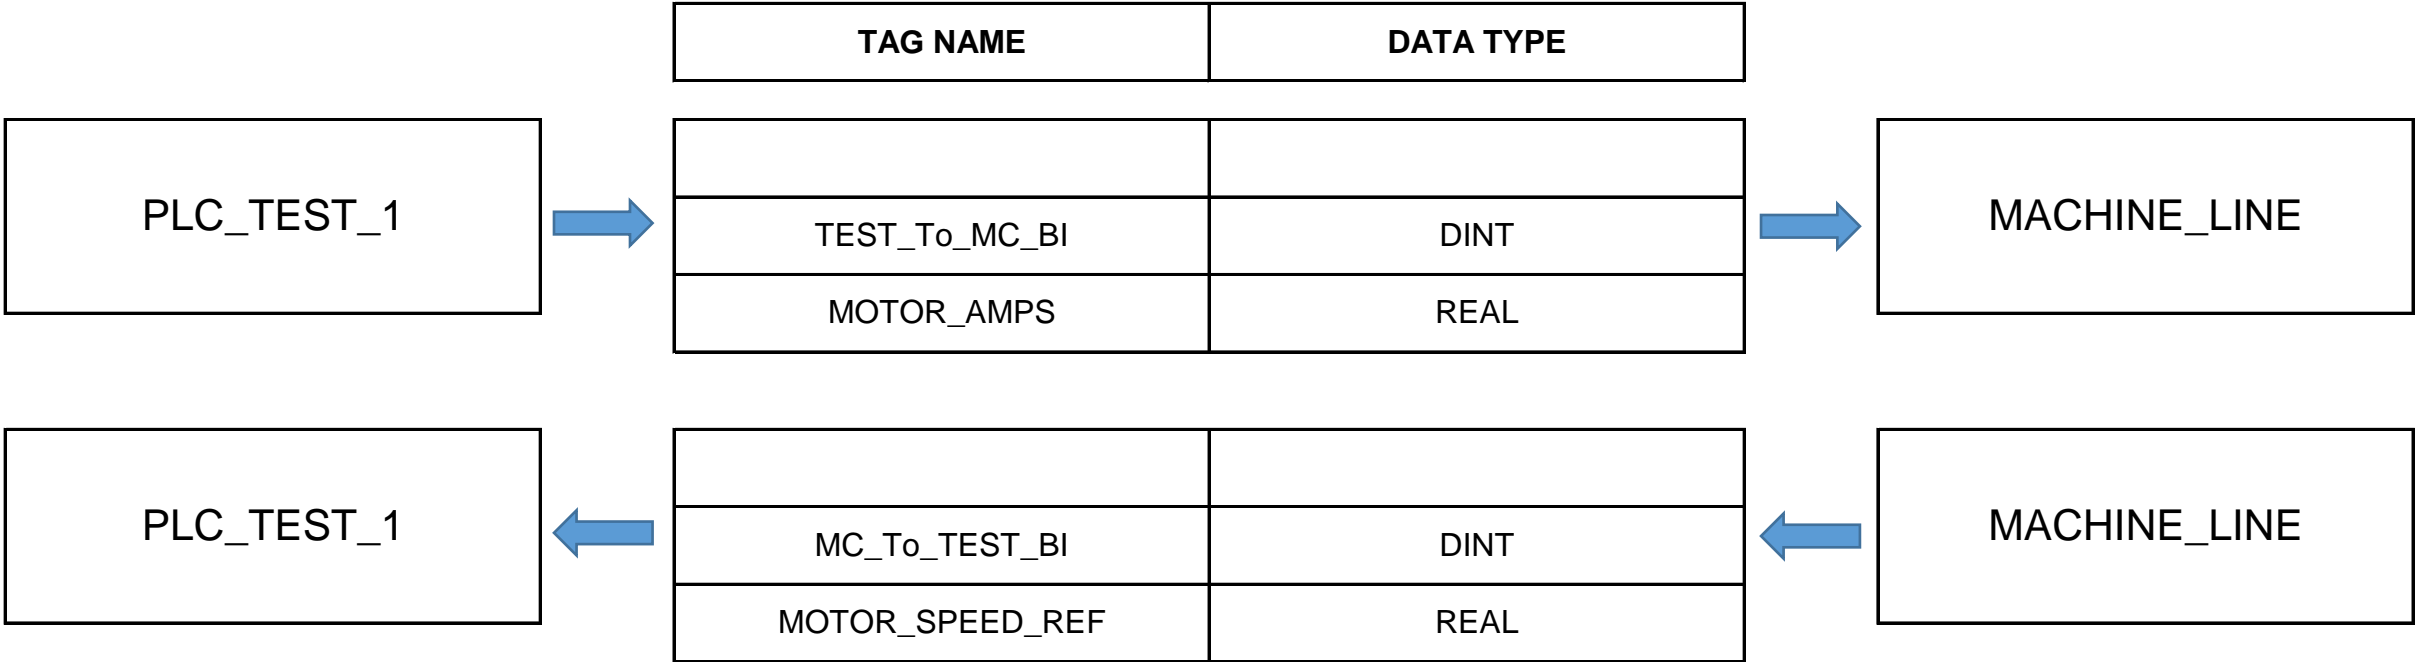

COMMUNICATION BETWEEN TWO PROCESSORS: BY MEANS OF "PRODUCED / CONSUMED " TAGS, OVER ETHERNET NW:

**WHAT IT MEANS:** THE TAG "PRODUCED" BY ONE PROCESSOR, GETS "CONSUMED" BY THE OTHER PROCESSOR, & VICE VERSA.

RSLogix 5000 -- PART 6

PROJECT TASK: WE WOULD BE EXCHANGING THE FOLLOWING TAGS BETWEEN THE TWO PROCESSORS:

NOTE: IF WE HAVE TO EXCHANGE BETWEEN THE TWO PROCESSORS, BY PRODUCE / CONSUME TAGS, WHEN WE EXCHANGE BINARY, I.E. "BITS", ONE OF THE BEST PRACTICES TO USE TAGS FOR EXCHANGE AS "DINT", I.E. A DOUBLE INTEGER. WHAT IT MEANS: ONE SINGLE EXCHANGE IT TRANSFERS "32 BITS" OF DATA. WE CAN "ALIAS" THOSE INTENDED BITS TO IT, -- THE BENEFIT EXPLAINED LATER,

PANEL VIEW PLUS -- PART3

HMI: DOWNLOADING PREPARATION: Understanding the Concept

|   |  |   |
|---|--|---|
| ➡ | UNLIKE PLC: CAN-NOT DOWNLOAD DIRECTLY, BUT ONLY A "RUN" OR .MER VERSION  |   |
| ➡ | BEFORE WE CREATE A RUN / .MER VER, SET UP IT'S <b>COMMUNICATION (COMM)</b> .<br>WHAT IT MEANS: " <b>TO WHOM IT WOULD BE TALKING TO AND HOW</b> "?  |   |
| ➡ | <b>TWO WAYS TO SET UP COMM:</b>  | ➡ SET IT UP OFF-LINE, THE DIFFICULT ONE |
|   |  | ➡ SET IT UP ON-LINE, THE EASIEST ONE    |
| ➡ | ONCE COMM IS SET-UP, CREATE THE RUN Or .MER VERSION  |   |
| ➡ | ONCE DOWNLOADED, MAY GET <b>SOME ERRORS</b> , WILL COVER SOME MOST COMMON ERRORS   |   |
| ➡ | ONCE ERRORS TAKEN CARE OF, <b>CREATE RUN / .MER FILE AGAIN, DOWNLOAD IT AGAIN</b>  |   |
| ➡ | <b>POSSIBLE RUNNING</b> DIRECTLY FROM THE COMPUTER:<br>ONCE NO ERROR, & COMM IS SET-UP CORRECT, IF CONNECTED TO THE TARGET PLC ONLINE, CAN RUN THE <b>INDIVIDUAL PAGE</b> DIRECTLY FROM YOUR COMPUTER, EVEN BEFORE YOU DOWNLOAD TO HMI.<br><b>EXCEPTION: ALARMS PAGE</b> |   |

**NOTE:** IT IS REALLY IMPORATNT THAT YOU FOLLOW THE ABOVE STEPS, BEFORE YOU CREATE A RUN OR .MER VERSION. JUST REMEMBER, TO CREATE A .MER FILE IS VERY SIMPLE, BUT MAY NOT WORK.....
